KEYWORDS G6PD Deficiency. Sick Cell Hemoglobin. Endogamous Tribe

ABSTRACT G6PD and sickle cell hemoglobin have been used as important markers in Anthropology. The present study deals with the screening of these markers among the Dhodias, an endogamous tribe of Dadra Nagar Haveli. Out of the 74 males screened for G6PD deficiency, 13.5% of them are found to be deficient and out of 149 sample tested for sickle cell hemoglobin, 18.10% are found to have hemoglobin S (3.34% have HbSS and 14.76% have HbAS). The allele frequencies for *GD*def* and *HB*S* were 0.135 and 0.107, respectively.

INTRODUCTION

Glucose-6-Phosphate Dehydrogenase (G6PD) is an important enzyme (coded by a gene located at Xq28) in the pentose phosphate pathway, a metabolic pathway that supplies reducing energy to cells by maintaining the level of the co-enzyme nicotinamide adenine dinucleotide phosphate (NADPH). On the other hand, Sick cell hemoglobin is an inherited condition characterized by defective hemoglobin (giving a sickle shape to red cells instead of circular) and the gene responsible for this defect is located on the short arm of chromosome 11. Both have been used as important markers in Anthropology.

MATERIAL AND METHODS

Area and People: Dadra Nagar Haveli, which has an area of about 491 sq. km. consists of two separate parts- Dadra and Nagar Haveli. Dadra is surrounded by the state of Gujarat and Nagar Haveli is situated on the border of Maharashtra and Gujarat. Dadra consists of 3 villages and Nagar Haveli has the town of Silvassa and 68 villages. According to 2001 Census of India, its population is 220451 with the sex ratio of 810.9 females per 1000 males. Its literacy rate is 60.03%. Dhodias constitute 16.91% of the total population and are mostly settled in the northern part of this union territory. They are endogamous tribe practicing clan exogamy. They do not practice consanguineous marriages.

Methods: Blood samples were collected from 149 individuals (75 females and 74 males) in

ependorf tubes coated with 0.5M EDTA using the finger prick method in the month of January 2007. Special care was taken to avoid collection of samples from related individuals up to first cousin. Screening for G6PD deficient (males only) was done using fluorescent spot test (Beutler and Mitchell 1968). Sodium metabisulphite/ slide method (Daland and Castle 1948) was used to screen for sickle cell hemoglobin and for determining the zygosity agar gel electrophoresis method was used (Robinson et al. 1957). Allele frequencies for *GD*def* and *HB*S* were calculated using gene counting method and Hardy-Weinberg equilibrium was tested using χ^2 goodness of fit test.

RESULTS AND DISCUSSION

In the present study, 13.5% of the male population is found to be G6PD deficient (Table 1). The earlier reported frequency for this population was 6.35% (Joshi et al. 1978). When comparing with the present data, it showed non-significant difference ($\chi^2 = 1.90$, $p = 0.168$, d.f. = 1). It also showed non-significant difference with the two other tribes of this union territory - Varli ($\chi^2 = 1.15$, $p = 0.283$, d.f. = 1) (Joshi et al., 1978) and Konkans ($\chi^2 = 0.31$, $p = 0.580$, d.f. = 1) (Joshi et al. 1978). The gene frequency for *GD*def* is 0.135. The frequency is also well within the reported range of western region, i.e. 0.000 to 0.196 (Bhasin 2006).

All 149 samples were tested for hemoglobin S (HbS). 18.10% were found to have hemoglobin S (3.34% were homozygous and 14.76% were heterozygous) (Table 2). The population is in

Table 1: Distribution of G6PD deficiency among Dhodias (Males) of Dadra Nagar Haveli.

No. test- ed	Normal		Deficient		Allele frequency GD*def.
	No.	Per- centile	No.	Per- centile	
74	64	0.865	10	0.135	0.135

Table 2: Distribution of sickle cell Hemoglobin among the Dhodias of Dadra Nagar Haveli.

	No.	Percentile	Allele frequency
AS	22	0.148	HB*A 0.893
SS	5	0.033	HB*S 0.107
AA	122	0.819	
Total	149	1.000	1.000

Hardy-Weinberg equilibrium with respect to HbS ($\chi^2 = 3.510$, $0.10 < p < 0.05$, d.f. = 1). An earlier study (Joshi et al. 1978) had reported a frequency of 21.53% for this population. In comparison with the present data, it shows non-significant difference ($\chi^2 = 0.341$, $p = 0.559$, d.f. = 1). It also shows non-significant difference with Dhodias of Surat district ($\chi^2 = 0.005$, $p = 0.945$, d.f. = 1) (Vyas et al. 1962) and of Bulsar district ($\chi^2 = 0.878$, $p = 0.349$, d.f. = 1) of Maharashtra (Negi 1976). HB*S frequency was found to be 0.107, which also lies within the earlier reported range of the western region, i.e. 0.000 to 0.167 (Bhasin 2006).

The observed increase in the frequency with respect to G6PD deficiency and decrease in case of sickle cell hemoglobin, in the presently studied population, as compared to previous data on the same population, about a generation ago is not statistically significant ($\chi^2 = 1.90$, $p = 0.168$, d.f. = 1 and $\chi^2 = 0.341$, $p = 0.559$, d.f. = 1 respectively). However, the Dhodias of Dadra Nagar Haveli

need special health care regarding the two selected genetic disorders.

ACKNOWLEDGEMENT

We are very thankful to the Department of Anthropology, University of Delhi for funding our field trip to Dadra Nagar Haveli. Our special thanks to Dr. K.N. Saraswathy for her guidance and cooperation in completing this paper. We are also thankful to the people of Dhodias of Dadra Nagar Haveli for their cooperation.
