KEYWORDS Fertility. Garo. Martilineal. Sibsagar. Socio-culture Factor. Christian

ABSTRACT The study deals with the fertility performance of the Garo women living in the village in the Sibsagar district, Upper Assam. An attempt is also made to co-relate fertility performance of the women with some socio-culture factors like education of the women, family type and occupation of the husband. The study reveals differential fertility in different socio-economic groups. The Garo women exhibit comparatively lower fertility than many other communities of North-east India as reported earlier.
