KEYWORDS Polydactyly. Synpolydactyly. Pedigree. Inheritance. Haryana

ABSTRACT In the present investigation, nine families belonging to Meos and Sunni Muslims of Haryana were found to be affected with polydactyly and syndactyly. The pedigrees of affected families were analyzed up to a minimum of three generations. An autosomal recessive mode of inheritance of polydactyly/synpolydactyly has been suggested in all these families except one where the possible mode of inheritance seems to be X-linked recessive.
