KEYWORDS Women. Decision-Making Power. Fertility. Children and Empowerment

ABSTRACT Decision making process is generally influenced by the level of knowledge. Women are the integral part of family and vital force in the socio-economic progress. The present study is undertaken to analyse the Decision-Making Power among married and unmarried women. Scale regarding 'Decision Making Power among Women' constructed by Jan (2004) was used on 100 women, selected through multi-stage sampling method. The paper reveals that there is no significant differences between married and unmarried women regarding their decision making power. However, highly significant differences are observed, between married and unmarried women, related to their empowerment. Women generally possess low decision making power and are mainly dependent on masculine and/or familial decision making.
