ABSTRACT In the present paper an attempt has been made to study the utilization of antenatal care (ANC) services among the Scheduled Tribe population in the major states of India. It has also tried to sort out some of the social variables responsible for the non-utilization of the antenatal care services. For this study data has been extracted from National Family and Health Survey which was conducted in 26 major states of our country in 1992-93. Besides percentage distribution the technique of Pearsons Correlation has been adopted to analyze the data.
