

Ethics and Biology: Some Reflexions of A Biologist

Walter Verraes

KEYWORDS Ethics. Brain. Behavior. Social Biological Nature

ABSTRACT We discuss the notion “ethics”, being at the one hand a product of physico-chemical reactions in brains, and a field of reasoning around values of behavior at the other hand. Both are fully anchored in our social biological nature. What we consider to be moral behavior is not restricted to human beings. The social function of being moral in an open society is analysed.
